

ABSTRACT

A light-emitting device indicating a location of an outside door handle comprising a lamp, detecting part, and control part, wherein the lamp is disposed inside a pushbutton. The detecting part detects whether the engine is activated or deactivated and whether the door is opened or closed. The control part turns the lamp on when the
5 detecting part senses that the engine has stopped running and the door has opened. The light-emitting device provides illumination to the pushbutton at the outside door handle in order for the driver, after having exited the vehicle, to easily locate the pushbutton for locking the door in the dark.
